

Real-Estate Labor Evidence and Economic Sensitivity

NAME _____

DATE _____

PERIOD _____

Fixed BLS Evidence Card

Source: U.S. Bureau of Labor Statistics, Occupational Outlook Handbook, current page accessed August 2026.

- Real Estate Sales Agents: **\$56,320 May 2024 U.S. median annual wage.**
- Real Estate Brokers: **\$72,280 May 2024 U.S. median annual wage.**
- Combined group: **3% projected growth, 2024-34.**
- Combined group: **about 46,300 annual openings on average.**
- BLS employer distribution lists **54% self-employed** for each occupation in 2024.
- BLS wage figures **exclude self-employed workers.**
- Work may slow during declining economic activity or rising interest rates.

One source/date/geography/measure label I must keep:

Compare the Two Wage Figures

Broker median: \$ _____ Sales Agent median: \$ _____

Difference: \$ _____

What the comparison supports:

What it does not prove about DFW, starting pay, or one worker:

Growth and Openings

Why can 3% growth appear beside about 46,300 annual openings?

Why are annual openings not live postings or proof of a shortage?

One local question the national source cannot answer:

Self-Employment and Economic Sensitivity

Why must the 54% self-employed fact be kept separate from the wage figures?

How could higher interest rates or declining economic activity affect work?

One other factor a worker would verify before choosing the occupation:

Fictional Jordan Recommendation

Jordan values flexible scheduling but needs predictable monthly income.

Two BLS facts Jordan should use:

1.

2.

One risk or limitation:

Recommended next investigation step and why:
